Deadline: 27-NOV, 11:59pm

The Bellman-Ford Algorithm

In this assignment, you are asked to implement the Bellman-Ford Algorithm which solves the single-source shortest-paths problem. Specifically, you are given as input a directed graph G = (V, E) with weight w(u, v) on each edge $(u, v) \in E$ along with a source vertex $s \in V$. Edges may have negative weights.

Input The input has the following format. There are two integers on the first line. The first integer represents the number of vertices, |V|. The second integer is the number of edges, |E|. Vertices are indexed by $0, 1, \ldots, |V| - 1$. Each of the following |E| lines has three integers u, v, w(u, v), which represent an edge (u, v) with weight w(u, v). Vertex 0 is the source vertex.

Output The output falls into two possible cases.

Case (i): There is no negative-weight cycle reachable from s. In this case, you must output TRUE on the first line, followed by the shortest distance from s to each vertex in the graph. More precisely, you must output TRUE, $\delta(0,0)$, $\delta(0,1)$, ..., $\delta(0,|V|-1)$, one per line. Recall that $\delta(u,v)$ denotes the shortest distance from u to v. If a vertex v is not reachable, output INFINITY in place of $\delta(0,v)$.

Case (ii): There is a negative-weight cycle reachable from s. You must output FALSE.

Examples of input and output

Input 1 6 10

0 1 6

1 2 5

1 3 -4

1 4 8 2 1 -2

3 0 2

3 2 7

3 4 9 4 0 7

5 2 5

Output 1

TRUE

0

6

9

11

INFINITY

6 11 0 1 6 1 2 5 1 3 -4 1 4 8 2 1 -2 3 0 2 3 2 7 3 4 9 3 5 -14 4 0 7 5 2 5 Output 2

Input 2

FALSE

Note that every line is followed by an enter key.

See the lab guidelines for submission/grading, etc., which can be found in Files/Labs.
